

a

Training contexts

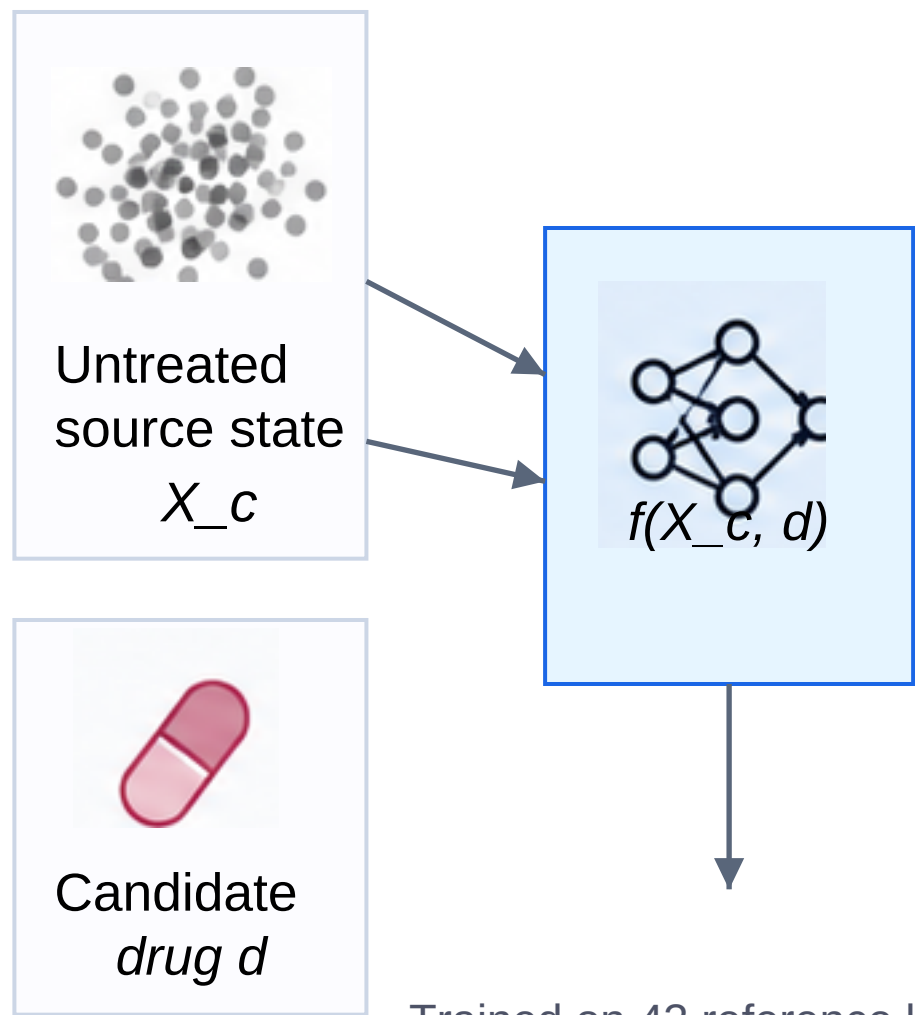

43 reference cell lines
observed drug responses

fit on 43 reference lines

Forward response predictor

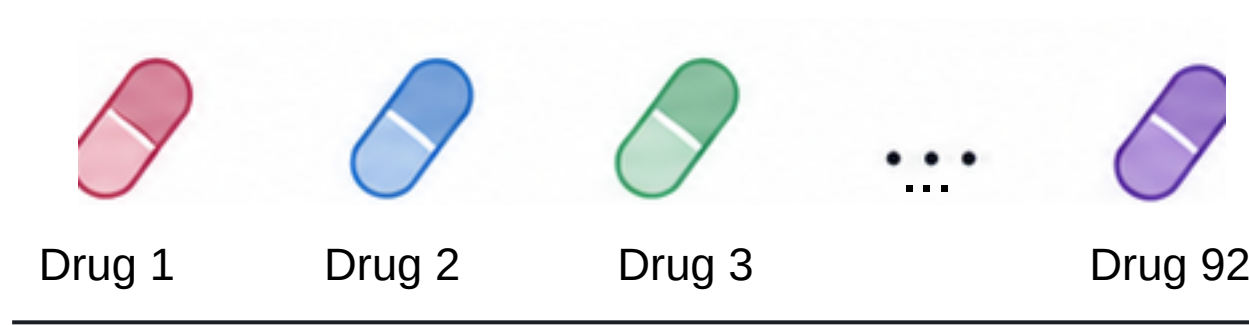

$f(\text{source state}, \text{drug})$

Trained on 43 reference lines
(held-out line excluded)

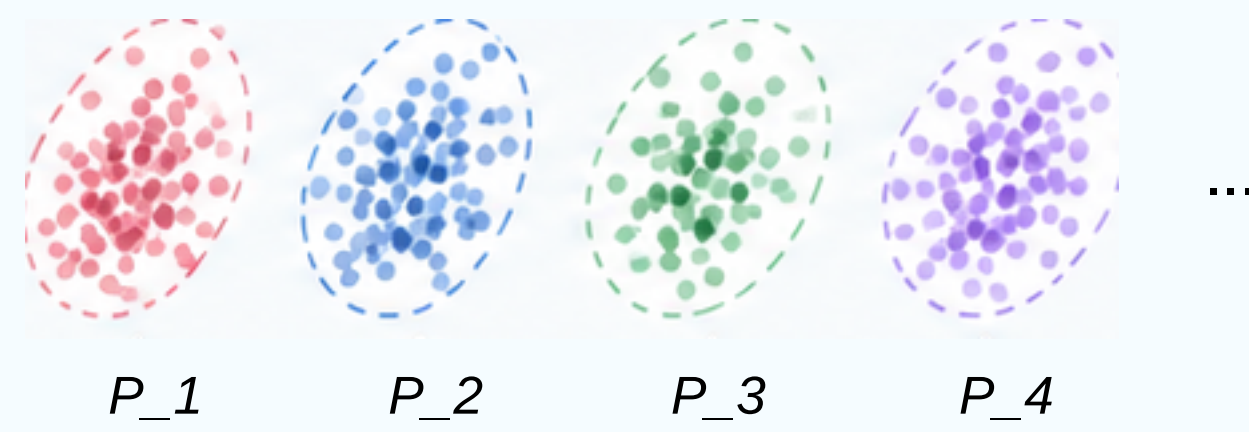

Held-out cell line

92 fixed candidate drugs

Predicted candidate responses

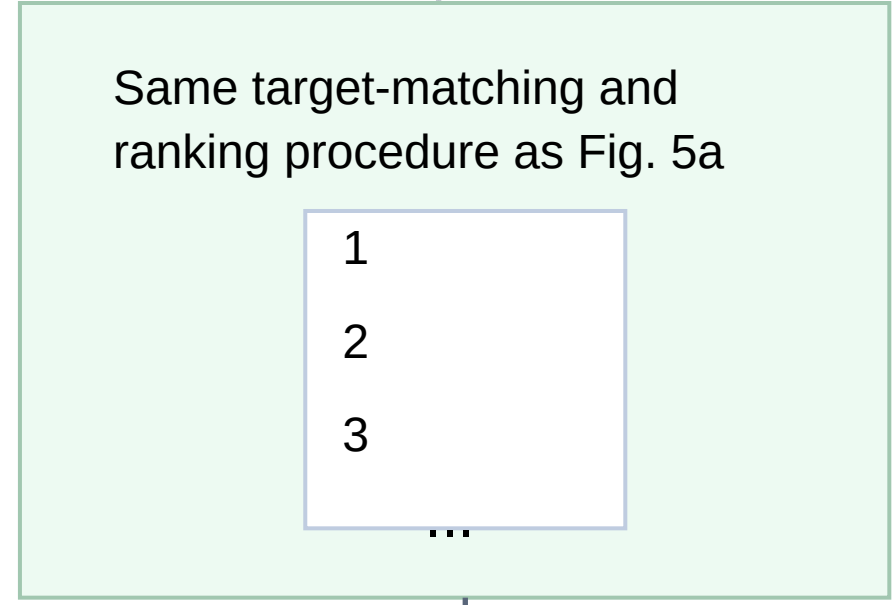

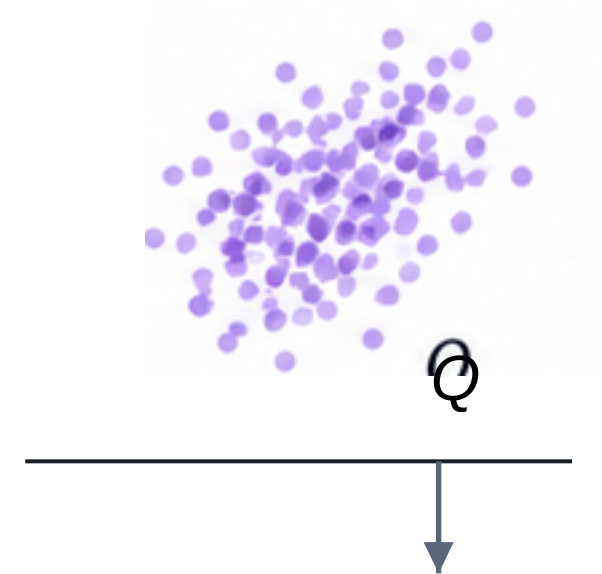

predicted in the held-out line, not observed

$P_{d,c} = f(X_c, d)$

Target population Q

Wanted state

Does the oracle population advantage survive prediction?

Prediction-constrained intervention-identification task in a held-out cell line

Candidate outcomes are predicted rather than observed; the target population is given only to the retrieval scorer.
